Editorial

Dear Colleagues,

It gives me great pleasure to present the second issue of the *Case Reports in Odontology*. This issue includes the scholarly and clinically interesting and unique case reports in various disciplines such as Dental Anatomy, Oral and Maxillo-Facial Surgery, Oral and Maxillo-Facial Pathology, Oral Microbiology, Periodontology, Implantology, Prosthodontics and Rehabilitation, Pedodontics and Preventive Dentistry, Orthodontics, Oral and Maxillo-Facial Orthopedics, Restorative and Esthetic dentistry.

The *Case Reports in Odontology* provides the platform for researchers across the globe to report and publish clinically and academically interesting and unique case reports in various disciplines of dentistry. In line with this aim, the present issue of the *Case Reports in Odontology* offers various clinically interesting and unique case reports from different corners of the globe. The variety of the subjects covered and the nationalities represented have helped us in truly reflecting the nature of our journal.

The first case report, titled- *Lichenoid Reaction to Amalgam Restoration- a Case Report* is from Kerala, India and reports a case of oral lichenoid reaction to amalgam and focuses on the local toxic effects of amalgam as dental restorations with particular reference to oral lichenoid reactions (lesions).

The second scholarly case report- *Multiple Mandibular Supernumerary Supplemental premolars- a Non-syndromic Bilateral Presentation in a Female Libyan Patient-* is from Sebha, Libya. Supplemental tooth are tooth that resemble a tooth of normal series. The presence of bilateral supernumerary premolars in absence of any associated syndromes or systemic conditions is extremely rare. And this rare phenomenon is presented in this second case report in this issue.

The third, clinically quite interesting and scholarly, case report- *Reattachment of Fractured Anterior Tooth- a Conservative Approach-* is from Davangere, India. It demonstrates how the reattachment of fractured tooth fragment is the best method of restoring the functions, esthetics and biological properties of the tooth structure rather than prosthetic and artificial looking restorations.

Unusual Calculus Mass in Floor of Mouth: a Case Report is from India and describes the presentation of a huge mass of calculus in the floor of the mouth.

As the primary aim of the *Case Reports in Odontology* is to generate and disseminate new knowledge on various disciplines in Dentistry, we provide immediate open access to its all content to the global academic and research fraternity to help in catering to the research and academic needs of those who are in search of knowledge.

To sum up, I take this opportunity to invite the researchers to submit their case reports to the next issue of the *Case Reports in Odontology* in June, 2015, by adhering to the policies and manuscript guidelines of the journal, as due to the editorial and review policies, we could not include many case reports of our colleagues around the globe in this issue who showed their interest in *Case Reports in Odontology*.

With Best Regards,

Dr. Syed Wali Peeran

Department of Periodontology and Oral Implantology,
Faculty of Dentistry
Sebha University
Sebha, Libya
